B1 — APELDOORN

The New Red Dazzler that Brought Many
Visitors to Our Nursery Last Spring!

Planted in borders in front of our office
building, and in drifts between the Maney
Juniper, these Apeldoorn Tulips were a
sight to behold. Folks flocked in from near
and far to see and enjoy, and to take pic-
tures. This brand new, wonderful hybrid
from our Holland growers is a cross be-
tween Darwin and Fosteriana Tulips.
Blooms are gigantic in size, of superb tex-
ture and form, color the richest orange
scarlet with black base. They are borne on
strong, 20-in. stems, are earlier and larger
than Darwins, and long lasting. Don't miss
out on this amazing new Apeldoorn. Extra

There is nothing more thrilling in early spring than a bed or border of Red Emperor Tulips, or combined with Daffodils will give superb effect. LARGE, NO. 1, BLOOMING SIZE BULBS

HOW TO PLANT TULIPS

For long-time blooms, richest colors and tallest stems, plant tulips in a lightly shaded area; in the South, the east or north exposure is best. Tulips must be planted in the fall, the ideal period being when the tree leaves begin to fall up until the time the ground freezes. Plant 5 to 7 inches apart and 8 or 9 inches deep in good, well-drained garden soil. A thin layer of sand upon which to lay the bulbs is recommended. Place bulbs in the bottom of the trench, surrounding each one with good garden soil pressed firmly so no air pocket will be left. If the weather is dry after planting, **soak the bed thoroughly several times** to promote root growth. Just before the ground freezes, scatter a thin sprinkling of fertilizer over the top of the bed. After the ground freezes down two or three inches, cover the bed with several inches of shredded cornstalks, straw or some coarse mulching of that kind. Again the following spring when the Tulips are growing, if the weather is dry you will have better flowering results if you soak the bed well two or three times.

ESPECIALLY IMPORTANT FOR FALL!

The Ross Root Feeder puts water and fertilizer directly to the roots. Produces healthier and more vigorous growth. Especially fine for roses, shrubs and trees. You can fertilize and water at the same time, or just water. Needed all season. In the spring it is a quick booster for old and new plantings. In the summer it insures food and water during dry spells. In the fall it is very necessary to put moisture down to the roots (particularly Evergreens and Shade Trees), to prevent winter damage.

Simple, easy to use, nothing to get out of order and lasts for years. For watering, just attach to hose. For fertilizing, place cartridge in the chamber, attach to hose and turn on water. Push it into the ground to desired depth. No water or fertilizer is wasted. Feeder puts it DOWN AMONG THE ROOTS WHERE IT IS NEEDED.

Keep a supply of cartridges on hand.

Box of 12 for \$1.00 (Postpaid)

Regular cartridge (8-16-8) is used for most plants, shrubs roses, evergreens, trees.

Acid cartridge (10-20-20) is used for acid-loving plants such as Blueberries, Semi-Double Hydrangea, Azaleas, etc.

How We Sell Specimen Evergreens How You Should Plant Them

Individually Wrapped means specimen Evergreens are packed singly in sphagnum moss. We have been handling them in this way to reduce shipping costs for our customers, and to speed delivery. When planting Individually Wrapped trees, remove all of the packing material, soak roots thoroughly in water, then plant deeply and firmly in good well-prepared garden soil, using plenty of water. Until you have good rains, it is advisable to water heavily around the Evergreens 2 or 3 nights each week.

B&B means Balled and Burlapped. The tree is dug with a solid ball of rich, heavy loam in which it has been growing for years, completely covering and protecting the root system. In planting B&B Evergreens, dig hole 6 inches wider and deeper than the ball, and plant complete ball and burlap after you cut the strings and roll back burlap at top. Take care not to break the ball, and water heavily.

Be sure that the soil around your Evergreens freezes up wet this fall.

BALLED & BURLAPPED EVERGREENS

Below are approximate weights of B&B Evergreens, which will vary according to the variety and moisture content of the soil.

18-24 in.	40 to 50 lbs.
2-3 ft.	50 to 80 lbs.
3-4 ft.	80 to 100 lbs.

We advise shipping by Truck Freight if this service is accessible. In ordering be sure to give name of Trucking Company servicing your community. Express service is sometimes faster, and sometimes cheaper for one or two trees, but we advise your checking with the express agent on the 2nd class rate. Should you be located outside the Midwest States area, we recommend that you buy the Individually Wrapped Trees, which weigh considerably less. However, B&B is always the safest way to handle large specimen Ever-

PLANTING DIRECTIONS

Plant your trees as soon as they arrive, in good garden soil; it must be prepared in the same manner as for your garden. Set deeply and firmly in the ground after thoroughly soaking the roots in water, and water well around the trees until the ground freezes in the winter.

Seedling evergreens should be planted in a garden plot or beds for the first two years before transplanting permanently. A partial shade through the first summer is always beneficial. Small seedling and transplanted evergreens should be protected by a stake or wire netting to prevent their being trampled on.

See planting directions for Individually Wrapped and B & B evergreens on page 11. We give information on weights of B & B evergreens on page 11. Your success depends on how well you water around your Evergreens throughout the fall.

COLORADO BLUE SPRUCE

EF35—COLORADO BLUE SPRUCE. Famous, Silvery-Blue Evergreen, very symmetrical. One of the most popular for lawn and park planting, ideally used as a single specimen or in groups. It combines hardness with charm and beauty; 40-60 feet at maturity.

FERRIS' IRIS ARE STRONG AND HEALTHY — SO EASY TO GROW!

Plant them shallow in good, well drained soil in a sunny location, barely covering the roots with earth — 12 to 18 inches apart. Mulch through the first winter, applying 2 to 4 inches of straw, shredded cornstalks or coarse material of that kind after the ground is frozen down about 2 inches.
